

STATUS OF THE SQUARE KILOMETRE ARRAY

J. Santander-Vela*,
representing the SKA Organisation, Macclesfield, United Kingdom

Abstract

The Square Kilometre Array (SKA) is a international project to build a number of multi-purpose radio telescopes, operating as a single observatory, that will play a major role in answering key questions in modern astrophysics and cosmology. It will be one of a small number of cornerstone observatories around the world that will provide astrophysicists and cosmologists with a transformational view of the Universe. Two major goals of the SKA is to study the history and role of neutral Hydrogen in the Universe from the dark ages to the present-day, and to employ pulsars as probes of fundamental physics. Since 2008, the global radio astronomy community has been engaged in the development of the SKA and is now nearing the end of the *Pre-Construction* phase. This talk provides an overview of the current status of the SKA and the plans for construction, focusing on the computing and software aspects of the project.

INTRODUCTION

The Square Kilometre Array (SKA) is an international project that has the aim of building multi-purposes radio telescopes, with an equivalent collecting area of at least one square kilometre, and thus unprecedented sensitivity, so that key questions in modern astrophysics and cosmology can be answered.

The original SKA Science book was published in 2004 [1]. In 2015, *Advancing Astrophysics with the Square Kilometre Array* [2] was published with an update to the SKA science book after a decade of development of the SKA concept, incorporating more than 130 scientific use cases that will be possible thanks to the SKA telescopes.

Those science cases cover Galaxy Evolution, Cosmology and Dark Energy¹ [3–5], Strong-Field Tests of Gravity² [6], Cosmic Magnetism³ [7], The Cosmic Dawn and the Epoch of Reionisation⁴ [8], and research on the Cradle of Life⁵ [9]. The amount of physical disciplines foreseen to be encompassed by the SKA telescopes is one of the largest for any ground based facility to date.

The SKA project is currently in what is known as SKA Phase 1, or SKA1, in which two telescopes approximately with 10% of the target collecting area are being built, namely SKA1-Mid, and SKA1-Low, in order to prove the feasibility of the techniques and derisk the construction of the next phase of the project, SKA Phase 2, or SKA2.

⁵ <http://skatelescope.org/cradle-life/>

The goal is to have a single observatory entity, that will construct and operate two SKA1 telescopes (SKA1-Mid and SKA1-Low), with presence in three sites: Australia (SKA1-Low), South Africa (SKA1-Mid), and United Kingdom (Headquarters and central operations).

This talk focuses on the progress and status of the SKA1 telescopes. It starts by describing the SKA Organisation itself (Sec.), the current SKA timeline (Sec.), and the overall project organisation (Sec. ??).

SKA ORGANISATION

The organisation overseeing the SKA1 project is the SKA Organisation (SKAO), currently a limited liability non-for-profit company registered in England and Wales.

The SKAO is in the process of becoming an Inter-Governmental treaty Organisation (IGO), not unlike the European Council for Nuclear Research (CERN), the European Molecular Biology Laboratory (EMBL), or the European Southern Observatory (ESO). The timeline for that process will be detailed in Sec. .

Currently⁶ there are ten countries that are Full Members of the SKAO (listed in alphabetical order): Australia, Canada, China, India, Italy, New Zealand, South Africa, Sweden, The Netherlands, and United Kingdom. Other countries are involved in the design of the SKA1 telescopes, and it is estimated that ~20 countries and more than 100 organisations are contributed to that effort.

SKAO's headquarates are located within the boundaries of the Jodrell Bank Observatory, in the middle of the Cheshire plain, under direct view of the 70m Lovell Telescope.

As part of the UK commitment as host country for the SKAO HQ, and the IGO, an expansion to the HQ is being constructed with the intention of becoming a nexus for radio astronomy. An artist rendition of the new building can be found in Fig. 1, while the current status of the work, as of September 2017, can be seen in Fig. 2.

SKA1 TELESCOPES

As previously indicated, in this Phase 1 (SKA1) we intend to build two telescopes, SKA1-Mid, and SKA1-Low, within a cost cap for both telescopes of 674 MEur (2016 value).

The SKA1-Low will be located in Western Australia, within the Murchison Radio-astronomy Observatory (MRO), which defines a Radio Quiet Zone for the benefit of the SKA1-Low, but also the Australian SKA Pathfinder (ASKAP) and Murchison Widefield Array (MWA) precursor telescopes. Fig. 3 shows where the MRO is located, together with the positions of Geraldton (the designated Engineering

Operations Centre), and of the Pawsey Supercomputing Centre, currently the designated host for the Science Processing Facility.

SKA1-Low will consist of 131,072 log-frequency, dual polarisation dipole antennas, organised in 512 stations of 256 antennas each. There will be a core of antennas, where the stations will have an approximately circular shape, but no real boundaries, and remote stations beyond the core that will be distributed in clusters of six stations each, around three spiral arms. Fig. 4 shows a deployment of prototypes antennas at the MRO, with the typical density that is expected for a SKA1-Low station.

In South Africa, SKA1-Mid will be composed of 133 SKA1-Mid dishes, that will be integrated with the 64 MeerKAT dishes that will be retrofitted with SKA1-Mid style receivers and digitisers, in order to make them more easy to integrate as part of the SKA1-Mid telescope. Fig. 5 shows where the SKA1-Mid core site is located, together with the positions of Carnarvon (the designated Engineering Operations Centre), and of the Cape Town, currently the designated host city for the Science Processing Facility.

The interested reader can follow [10], that defines the baseline design capabilities of both the SKA1-Mid and SKA1-Low telescopes.

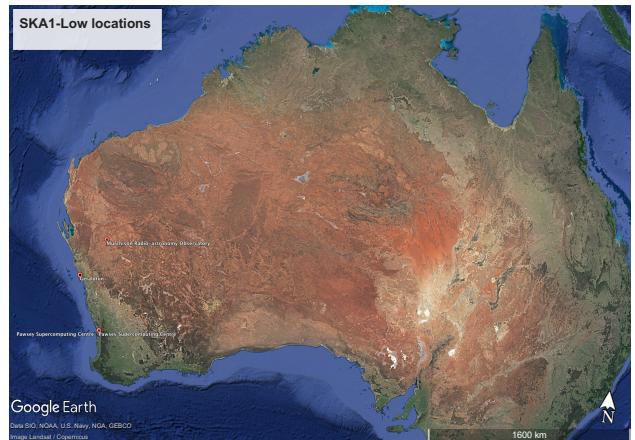

Figure 3: Relevant locations of SKA1-Low in Western Australia. The image shows the location of the Murchison Radioastronomy Observatory, the Engineering Operations Centre in Geraldton, and the Pawsey Supercomputing Centre, where we expect the Science Data Processor for SKA1-Low to be located.

SKA1 PRE-CONSTRUCTION

Both SKA1-Mid and SKA1-Low are being design by 9 international design consortia, which have each taken over 9 major high-level work packages that make up the work required to deliver the designs for those two telescopes:

DSH Dish Consortium, led by the Commonwealth Scientific and Industrial Research Organization (CSIRO; Australia); responsible for the design of the SKA1-Mid dishes, including their receivers, internal control system, and the delivery of tested SKA1-Dish prototypes;

LFAA Low-Frequency Aperture Array, led by ASTRON (Netherlands); responsible for the design of the SKA1-Low antennas and station-level beamforming and calibration systems, and the delivery of tested SKA1-Low antenna and station prototypes;

SADT Synchronisation and Data Transport, led by University of Manchester (UK); responsible for the design of the networks that interconnect Dishes (in SKA1-Mid) or Stations (in SKA1-Low) with the correlators, and the beamformed data and calibrated visibility data from the correlator/beamformer to the science data processing sub-system; it also includes the frequency and time reference system, and the UTC(SKA) implementation;

TM Telescope Manager, led by National Centre for Radio Astrophysics (NCRA; India); responsible for the design of the control and monitoring system of the telescope, and the observation management, from proposal handling, to planning, to live scheduling;

CSP Central Signal Processor, led by the National Research Council of Canada (NRC); responsible for the design of the SKA1-Mid and SKA1-Low correlator/beamformer,

Figure 4: SKA1-Low prototype antenna station as deployed in the MRO.

Figure 5: Relevant locations of SKA1-Mid in South Africa. The image shows the location of the SKA1-Mid site, the Engineering Operations Centre in Carnarvon, and the Cape Town, where we expect the Science Data Processor for SKA1-Mid to be located.

and also the PulSar Search (PSS) and PulSar Timing (PST) beam-data processing engines;

SDP Science Data Processor, led by University of Cambridge (UK); responsible for the design of the science processing of calibrated visibilities, transient data, tied-array beams, and beam-formed time-series data;

INAU Infrastructure Australia, led by the Commonwealth Scientific and Industrial Research Organization (CSIRO; Australia); responsible for the design of all supporting infrastructure of the SKA1-Low telescope, except for networking and telephony services;

INSA Infrastructure South Africa, led by SKA SA (South Africa); responsible for the design of all supporting infrastructure of the SKA1-Mid telescope, except for networking and telephony services, and of the site buildings, which are provided as part of the South African hosting agreement;

AIV Assembly, Integration, and Verification, led by SKA SA (South Africa); responsible for the construction roll-out plan and the verification, validation, and integration plans for the SKA1-telescopes.

There are three additional international consortia working on technologies that will not be used for the SKA1 telescopes, but will be part of either in future upgrades, or for SKA2 telescopes, as part of what is known as the Advanced Instrumentation Program (AIP):

MFAA Medium-Frequency Aperture Array, led by ASTRON (Netherlands); responsible for developing prototypes and de-risking aperture array technologies at medium frequencies (above 450 MHz);

PAF Phased-Array Feed, led by the Commonwealth Scientific and Industrial Research Organization (CSIRO; Australia); includes improvements to the Phased-Array Feed (PAF) technology being developed for the ASKAP precursor telescope;

WBSPF Wide-Band Single Pixel Feed, led by Chalmers University (Sweden); responsible for the design of broad-spectrum, single-pixel feed receivers, that go beyond 4:1 bandwidth ratios;

These consortia are not directly funded by the SKA Organisation, but instead the organisations making up those consortia get their funding through funding programs created by the member countries of the SKA, or by non-SKA-specific funding instruments from countries not yet members of the SKA. This is specific for the Pre-Construction phase.

The framework for funding the construction is being negotiated together with the IGO Convention, but it will most likely consist of a mixture of cash and in-kind contributions to the future SKA IGO, with measures to attempt a *juste retour* to member countries.

The Convention will be initialised in October 2017, with Convention Signing by the representatives of the members in January 2017. After that, a ratification process in each member country is required.

The SKA IGO Convention will enter into force when at least 5 member countries, with the 3 host countries (Australia, South Africa, and United Kingdom) among them, have ratified the Convention. After that date, there will be a period of coexistence between the SKA IGO and the SKA Organisation, and a take over process of the SKA Organisation assets by the SKA IGO will take place during the Transition period.

Meanwhile, the Pre-Construction engineering process will end up with Critical Design Review (CDR) process for all design workpackages, and a following System CDR. When the CDR process is closed out, a Construction Proposal will be created to be ready for the moment in which the SKA IGO Council exists. Acceptance of the proposal is expected around Q3 2019, with construction ramping up after that.

The timeline for the above mentioned events is shown in Fig. 6.
